JANUARY 1951

Volume LV No. 1

SAN FRANCISCO: 1951

CALIFORNIA - JANUARY 1951

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 44.4° or 0.2° above the weighted mean. The unweighted average temperature based on the same 317 stations was 44.6° or 0.4° above the unweighted mean. The highest temperature, 94°, occurred at Indio U. S. Date Garden in Riverside County on the 26th. The lowest temperature, 12° below zero, was recorded at Boca in Nevada County on the 20th.

The average precipitation for the State based on 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 4.04 inches or 0.06 inch above the weighted mean. The unweighted average based on the same 314 stations was 4.41 inches or 0.13 inch below the unweighted mean. Based on 659 stations listed in Table 3, the average precipitation was 4.54 inches or 0.15 inch above the unweighted mean. The greatest monthly total, 21.70 inches, was reported from Gasquet Ranger Station in Del Norte County. Two stations, Independence Onion Valley and Greenland Ranch in Inyo County, reported no measurable precipitation. The greatest daily amount, 5.25 inches, was recorded at Laytonville, Mendocino County, on the 21st.

Snow Laboratory Central Sierra at an elevation of 6902 feet reported the greatest monthly snowfall, 124.6 inches. Some other heavy monthly snowfalls were as follows: Soda Springs, 97.0 inches; Cisco Ranger Station, 68.7 inches.

Soils in the north coastal area remained too wet for field operations. Grasses on pastures and ranges were reported the best in years due to mild weather and abundant rainfall. Heavy rains on the 21st resulted in a sharp rise to above flood stage on the Eel River with water remaining above flood stage until 10:00 a.m. on the 23rd. The highest stage was 23.2 feet, almost six feet above flood stage, and the highest stage since January 22, 1943. Considerable property damage resulted, but no lives were lost. This was the third flood of the season.

Weather in the central coastal area during the first week was generally favorable for crops. Grasses made considerable growth, and pruning in orchards and vineyards progressed. The cool weather generally retarded growth of truck crops and favored dormancy in deciduous fruit trees. On the 11th, several small tornadoes struck the Sunnyvale-San Jose district. Strong winds and some thunderstorms occurred in northern districts extending from San Francisco to Ukiah. In the path of the tornado which passed through Sunnyvale from 0825-0830 PST, flimsy buildings were demolished; other buildings sustained lesser damage such as windows blown out or roofs blown off, etc.; some orchard trees were uprooted or twisted off above the ground; many ornamental and shade trees were twisted off or uprooted; power lines were broken; some power line poles were downed or snapped; television antennae were twisted and snapped; some automobiles were damaged; some houses were shifted on their foundations in a counterclockwise direction, etc. Total damage from this storm was estimated at $1,500,000. The tornado which struck the San Jose district at 0845 PST wreaked havoc on homes and business property. Elsewhere, due to strong winds, trees were forced down; power lines were broken; and considerable property damaged. The storm activity on the 11th was associated with a severe cold front over Northern California. Gusts of wind at San Francisco Airport reached 78 miles per hour at 0743 PST. Wet soils during the month generally curtailed farm work in some districts; however, some orchard pruning was accomplished. Grain planting was reported behind schedule in northern districts. During the last week, soils remained generally too wet for pruning and spraying operations in some districts. Cover crops in orchards and vineyards generally made rapid growth, and pastures and ranges continued in excellent condition.

Intermittent rains in the Upper Sacramento Valley favored grains and grasses but curtailed plowing and planting activities. Some spraying and pruning operations in orchards were accomplished only during brief periods without precipitation. Below freezing temperatures occurred on several occasions in the district east of the Sacramento River; however, no damage was reported. East of Red Bluff Airport, strong winds on the 17th resulted in considerable damage in a strip approximately 50 feet wide and one-half mile long. Livestock remained in good shape, and some lambing progressed. Ranges manifested more than average growth for this time of year with feed in very good condition.

Some pruning in orchards was accomplished during the first week in the Lower Sacramento Valley. Fruit buds swelled prematurely, and a few almonds actually bloomed in northernmost districts due to previous warm weather. Soils remained generally too wet for plowing or weed cutting, and seeding was far behind schedule. Heavy rain in foothill areas resulted in quick runoff from low elevations below the snow line and overflows in most creeks and small tributaries on both sides of the Sacramento Valley on the 22nd-23rd. The first drying north wind of the winter accompanied the cold wave on the 29th and contributed to drying the top soil to some extent. Sugar beet harvesting was resumed as top soils dried. Although precipitation was below normal during January, an unusually large number of days with fog and drizzle occurred. A cold wave with killing frosts came near the end of the month with minimum temperatures ranging from 24-28 degrees in outlying districts.

Heavy frosts in the Lower San Joaquin Valley on the 1st and 2nd and light frosts on the 5th and 6th were beneficial in stimulating the return of most trees and vines to dormancy. At the same time, these frosts did not result in any widespread damage to truck crops. Pastures, ranges, and cover crops continued to flourish, and winter grains made excellent progress. Rains during the second week generally favored range grasses, grains, and cover crops, but hindered preparation of soils for spring crops. Excessive moisture was detrimental to corn. Thunderstorms, accompanied by small hail in some districts on the 11th, caused minor damage in local areas. On ten days, dense fog reduced visibility to one-fourth mile or less in the Fresno district.

Weather in the Upper San Joaquin Valley generally favored agriculture. On the 11th a thunderstorm occurred accompanied by a trace of hail. During the third week, rains temporarily halted cotton picking and made soils too wet in places for potato planting. Range grasses made satisfactory growth.

Frosts occurred in the Santa Maria area during the first several days, but very little damage was reported to truck crops. Pastures, however, were damaged by frosts in a few low places. Rains during the month benefited grasses which were beginning to deteriorate somewhat but delayed some planting and harvesting operations. Farm work generally progressed during the month except in San Luis Obispo County where some seeding was held up due either to soils being too wet or too dry.

At the beginning of the month, the Los Angeles area was in great need of more precipitation. The condition of grains and grasses had gradually deteriorated. Minimum temperatures in citrus districts during the first decade ranged generally as low as 26° to 28° with 24° to 25° reported in a few districts. Scattered light orchard heating was reported on mornings of the 7th, 8th and 9th. Only slight damage resulted in new citrus growth, and no damage was reported to fruit except in Ventura County. Light rains during the second week benefited all shallow rooted crops. Drought conditions sustained by grains, grasses, and cover crops were relieved, and considerable growth was reported in all but early planted dry-farmed grains, most of which had deteriorated beyond revival. On the 11th, strong winds in the Torrance district of Los Angeles County resulted in damages estimated at $100,000, when about 15 wooden structure oil well derricks were blown down and completely demolished. One derrick fell across power lines and caught fire and also caused shorting of power lines which blew fuses and damaged radio and television sets in the immediate vicinity. During the last week, a generous rainfall occurred to break drought conditions. Vegetables, cover crops, grasses, and grains made rapid growth under these conditions, but citrus continued to manifest adverse effects from the drought. Early peaches were stimulated to bloom in some areas, and a considerable build-up of red spider was reported due to the mild weather. Irrigation of citrus continued in most sections as subsoils remained very dry. Lowering of water in wells and drilling of new wells were making large expenditures of money necessary. Extremely high temperatures occurred in the Los Angeles area during the last decade with many daily maximum temperatures of record exceeded.

Light orchard heating was carried out in some of the citrus valleys of the San Diego area on the 1st-2nd and 7th-8th. Grains and range feeds were in great need of rain early in the month. Generous rains during the second week were of inestimable value to crops, and grains, ranges, and pastures improved. Amounts of one inch or more occurred in most agricultural areas, and from one-half to three inches of snow fell above the 3500 foot level. Rains again during the last week were of great benefit to crops. Unusually warm weather occurred from the 23rd to the 25th.

In the Imperial Valley unseasonably warm weather favored tomatoes, squash, and the few melon plantings, but adversely affected lettuce by contributing to loose heading and bolting. Sugar beets and flax made rapid progress.

HHE

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.

S Storage precipitation station. Precipitation measurements, made at irregular intervals,will be published in the June issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WEATHER SUMMARY

The average temperature for the State based on 316 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 47.1° or 0.2° below the weighted mean. The unweighted average based on the same 316 stations was also 47.1° or equal to the unweighted mean. The highest temperature, 94°, was reported at Palm Springs, Riverside County, on the 9th. The lowest temperature, 14° below zero, was recorded at Soda Springs in Nevada County, on the 23rd.

The average precipitation for the State based on 316 stations listed in Table 2 and wieghted with respect to the areas of the various divisions was 2.49 inches or 1.37 inches below the weighted mean. The unweighted average based on the same 316 stations was 2.72 inches or 1.71 inches below the unweighted mean. Based on 672 stations listed in Table 3, the unweighted average was 2.76 inches or 1.67 inches below the unweighted mean. The greatest monthly total precipitation, 15.25 inches, was recorded at Gasquet Ranger Station in Del Norte County. Seventeen stations in the southeastern interior reported no measurable precipitation. The greatest daily precipitation amount, 4.91 inches, was recorded at Cummings in Mendocino County on the 5th.

Soda Springs at an elevation of 6752 feet above mean sea level in Nevada County reported the greatest monthly snowfall, 68.0 inches. Snow Laboratory Central Sierra at 6902 feet reported a total snowfall of 67.4 inches.

Soils in the north coastal area continued generally too wet for field operations. Heavy precipitation on the 3rd and 4th brought the Eel River over its banks for the fourth time this season, resulting in considerable property damage. The crest of the flood reached 21.3 feet, or nearly four feet above flood stage, occurring on the 5th. Livestock continued in good condition with feed on ranges generally plentiful.

Cool weather in the central coastal area during the first several days generally benefited deciduous fruit trees by holding them in dormancy. Freezes on several nights resulted in some slight damage to vegetation with growth of grains, grasses, and other crops generally slow. Warm weather during the second week hastened development of crops with fruit trees reported blooming in the Mountain View district. Almond trees started to bloom in the Saint Helena district. During the third week some almonds were reported blooming in the Santa Clara Valley. In the Los Gatos district, Santa Rosa plum buds started to open. Spraying, cultivating, and seeding operations were generally hampered by wet soils in some districts during the month. Pastures and ranges continued generally in good condition; however, excessive moisture was detrimental to grains in some districts. In the Santa Clara Valley, the water table rose considerably. A thunderstorm was reported in San Francisco on the 22nd and snow and hail on the 26th and 28th.

Low temperatures in the Upper Sacramento Valley during the first week favored dormant fruit trees but slowed growth of grains and grasses. Pruning and spraying operations generally progressed, but soils remained too wet for grain planting preparations. Warm weather during the second week stimulated some early varieties of almonds to blossom. Rains during the last ten days hampered plowing and planting operations, and frosts damaged almonds in many locations where orchard heating was not carried out. A minimum temperature of 23.5° was reported in the orchard area east of Red Bluff with some damage to peerless almonds in the pink stage and considerable damage to those in full bloom. Winter ranges were in the best shape in years with only a small amount of supplemental livestock feeding necessary.

Weather in the Lower Sacramento Valley during the first portion of the month was generally unfavorable for crops. Lack of adequate sunshine and continued wet soils contributed to yellowing of cereals in northern, wettest districts. Moderate rains in all districts from the 4th to 6th resulted in a sharp rise in the Feather and American River tributaries and rises along the Stanislaus and Cosumnes Rivers. No damages were reported from high water. Moderate to fresh northerly winds in the Lower Sacramento Valley on the 12th-13th assisted in drying soils. Some sugar beet digging progressed, and some seeding of alfalfa and late winter cereals was reported. By the end of the month almonds and cherries were in bloom with apricots, plum, and prune buds swelling, but, due to cool weather, most truck crops were growing very slowly.

A rather severe cold period occurred in the Lower San Joaquin Valley with minimum temperatures as low as 28° reported on the 1st and 29° on the 2nd. Very little damage was reported to truck crops and no damage to citrus crops. Rains on the 4th and 5th were generally beneficial to agriculture; however, some agricultural operations were hampered by wet fields. Grapevine pruning and tying continued as weather permitted. A severe thunderstorm on the 11th resulted in 0.42 inch of precipitation in fifteen minutes at Weather Bureau Office, Fresno; winds accompanying this storm reached momentary gusts of 57 miles per hour. During the last half of the month, almonds started to bloom. Cotton harvesting was estimated at 98 percent completed. Heavy frosts also occurred on the 19th, 22nd, 24th, and 25th, and light frosts occurred on the 20th, 23rd, and 28th. Although no hail fell at the Weather Bureau in Fresno, some was reported in the eastern portions of the city on the 27th.

A severe freeze in the Upper San Joaquin Valley on January 31st and light frosts on February 1st and 2nd resulted in slight damage to potatoes which had emerged and some damage to celery. Peaches benefited by the cold weather, and citrus fruits escaped damage. Light scattered showers generally benefited grains and grasses. On the west side of the valley, however, range grasses were in need of more rain.

The lack of sufficient precipitation in the Santa Maria area retarded development of pastures. Rains were needed for all vegetable crops. Low temperatures and inadequate sunshine during the first week in the Santa Barbara district were unfavorable for the development of oranges and lemons. Unusually warm, dry weather during the second and third weeks was unfavorable for many crops. Pastures and ranges as well as grains began to deteriorate rapidly in some sections. Truck crops matured faster than usual due to the warm weather. Oranges and lemons in the Santa Barbara district benefited from the sunny weather. During the last week unusually cool weather with subfreezing temperatures occurred. Although some rain occurred, it was not of any great benefit to grasses and truck crops. Some frost was noted on peas in the San Luis Obispo district.

Minimum temperatures in the Los Angeles area dropped to below freezing on January 31st and to near freezing on February 1st and 2nd. Some scattered orchard heating was required mostly for lemons. Warm weather favored rapid growth of vegetation, particularly grains, grasses, and cover crops. Navel oranges matured rapidly, and Valencia oranges developed satisfactorily. Apricots and some cherries, plums, and citrus started to bloom in several districts. Rains during the last week were of some benefit to crops but generally insufficient due to the extremely dry condition of the soil. Many cover crops were turned under, and irrigation of orchards was started to wet subsoils prior to blooming. Pre-irrigation was required prior to preparation of soils for beans and other crops. Mountain streams were reported the lowest of record, and the absence of a snowpack for spring runoff presented prospects for a serious water shortage this summer. On the morning of the 20th wind machines were operated, and light orchard heating was carried out. Considerable orchard heating was carried out on the 21st and 22nd in colder districts particularly for lemons; minimum temperatures were reported as low as 26°.

Mild weather in the San Diego area favored all crops. Avocado harvesting continued in full swing with quality and sizes of fruit improved due to January rains. Showers which occurred during the last three weeks were too light to be of much benefit to crops. No runoff was reported in streams, and water tables continued to lower. Unusually large plantings of tomatoes were made under caps. By the end of the month almonds, apricots, and early peaches were blooming, and grapes were leafing.

Cool weather in the Imperial Valley during the first portion of the month benefited lettuce, carrots, and other vegetables. Weather during the last half of the month was generally favorable for early melons and other plants under hot caps. Flax, sugar beets, and alfalfa remained in excellent condition.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index

Station	Temperature							No. of days		Precipitation							No. of days		
														Snow, Sleet, Hail

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

/ Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

R This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

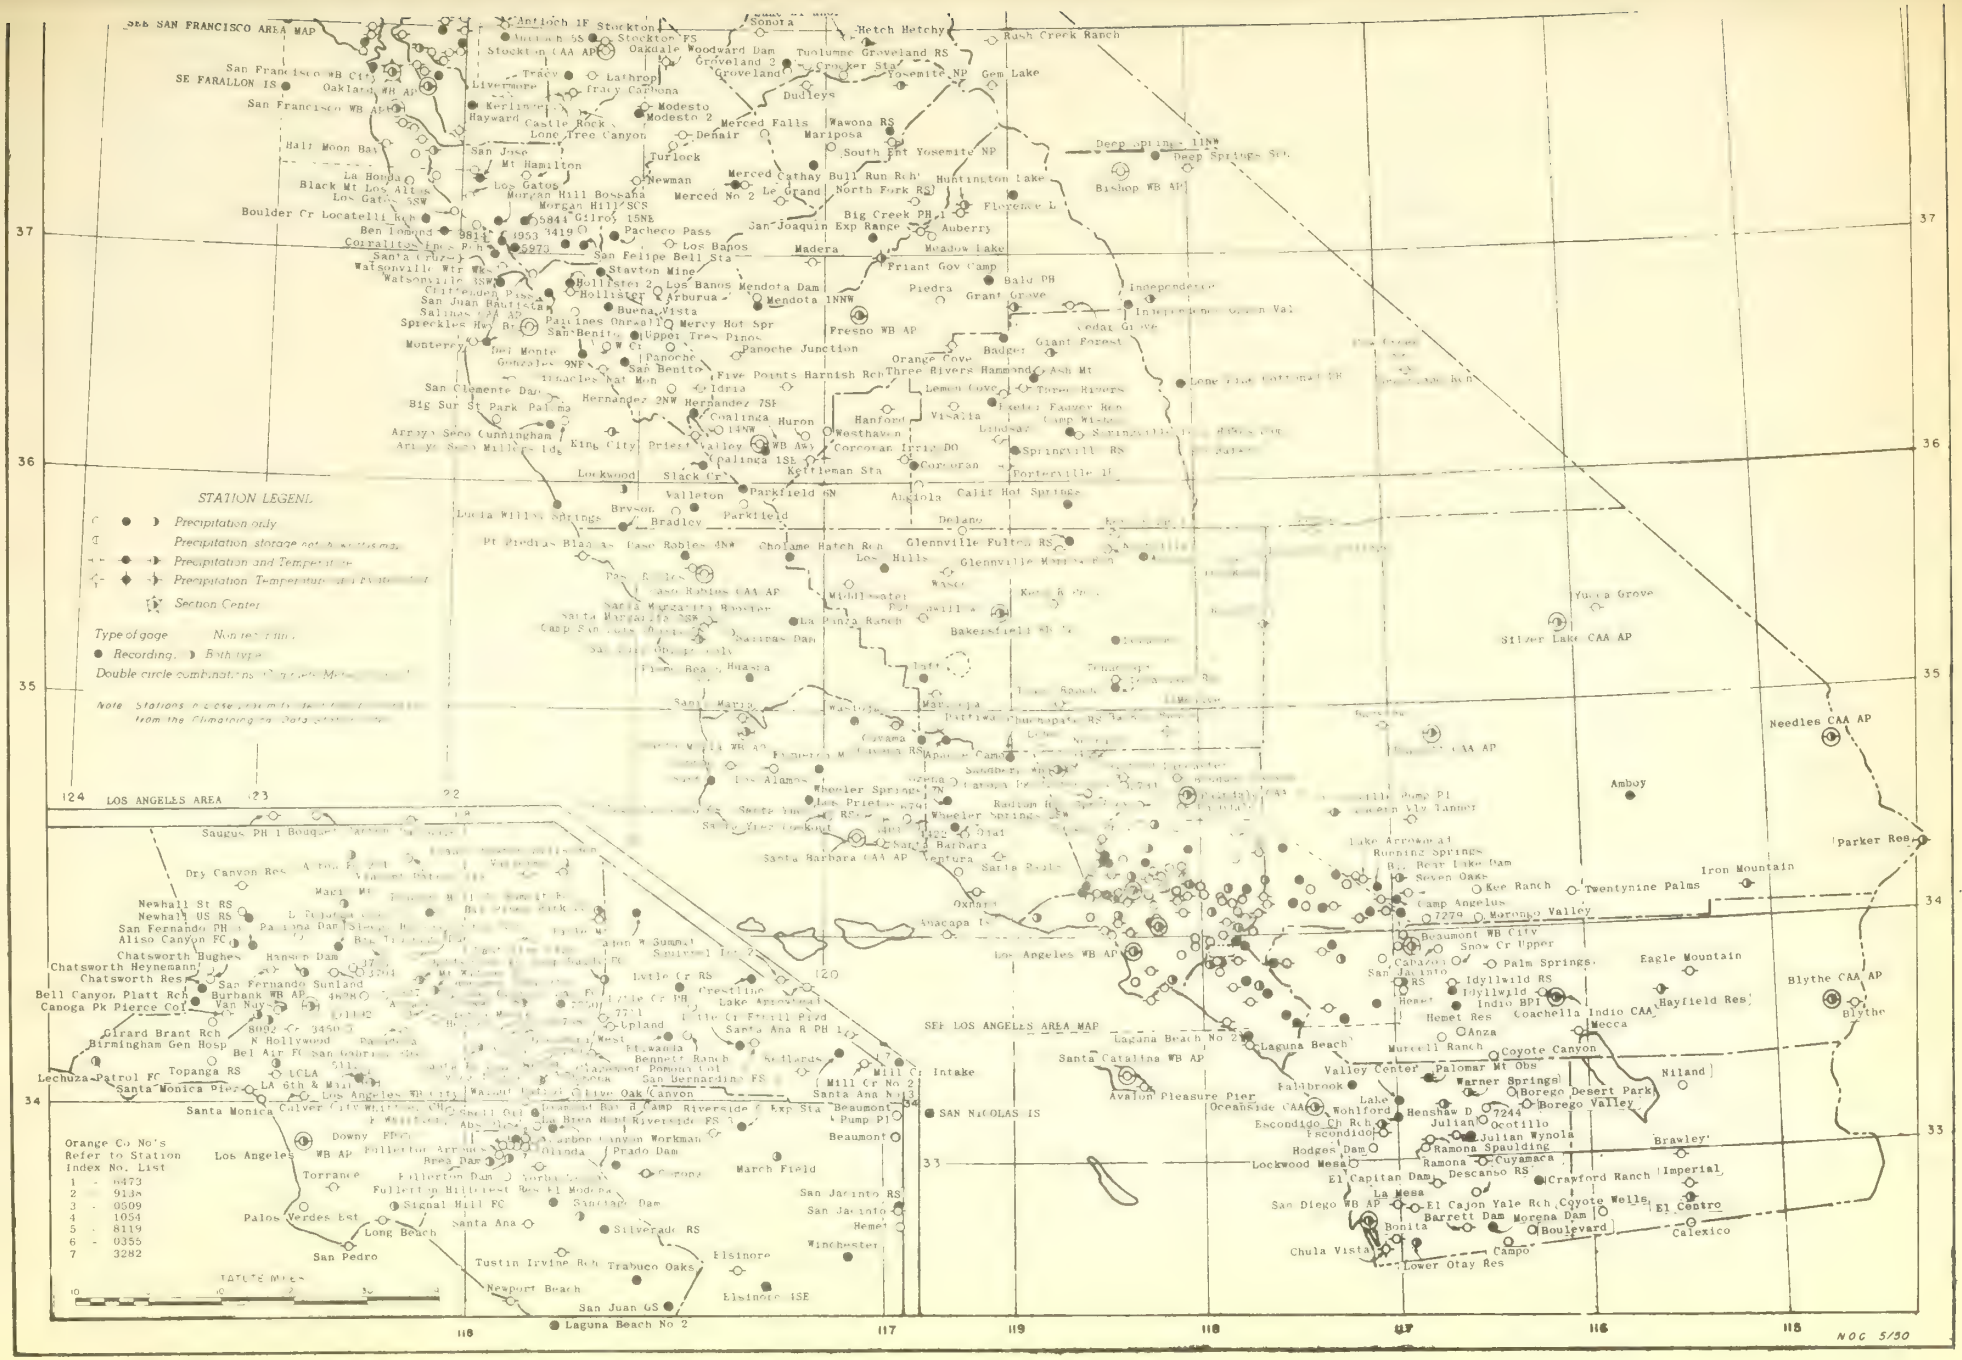
M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.

S Storage precipitation station. Precipitation measurements, made at irregular intervals,will be published in the June, July and August or delayed data December issue of this publication.

S This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.



V Includes total for previous month.

R This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

SAN FRANCISCO: 1951

CALIFORNIA - MARCH 1951

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 311 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 50.9° or 0.8° below the weighted mean. The unweighted average temperature based on the same 311 stations was 50.6° or 0.4° below the unweighted mean. The highest temperature, 96°, was reported at Mecca, in the Coachella Valley, on the 25th. The lowest temperature, 20° below zero, was recorded at Soda Springs in Nevada County on the 3rd.

The average precipitation for the State based on 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 1.36 inches or 1.56 inches below the weighted mean. The unweighted average based on the same 314 stations was 1.48 inches or 1.92 inches below the unweighted mean. Based on 657 stations listed in Table 3, the unweighted average precipitation was 1.42 inches or 1.98 inches below the unweighted mean. The greatest monthly total precipitation, 9.15 inches, was reported from Gasquet Ranger Station in Del Norte County. Twenty-one stations in the southeastern interior reported no measurable precipitation. The greatest daily amount, 4.18 inches, occurred on the 4th at Boulder Creek Locatelli Ranch in Santa Cruz County.

Blue Canyon WB Airport at 5280 feet in Placer County reported the greatest monthly snowfall, 64.7 inches. Snow Laboratory Central Sierra reported 52.5 inches and Soda Springs, 52.0 inches.

In the north coastal area rains and cold, cloudy weather generally restricted farming activities during the first half of the month. Some plowing and leveling operations got underway on higher lands during the last half of the month. Considerable gardening was also accomplished. Livestock remained generally in good condition, and feed on pastures and ranges was plentiful. By the end of the month strawberries were blooming.

Cool, cloudy weather in the central coastal area during the first week generally retarded development of some truck crops and delayed blossoming of some fruit trees. Warmer weather with abundant sunshine during the last three weeks stimulated rapid growth of crops. The absence of precipitation permitted considerable field and orchard cultivation. Winds and the general lack of precipitation contributed to a rapid drying of top soils which was generally unfavorable for pasture and range grasses. By the end of the month prunes and apples were blooming in several districts, and some scattered blossoming was reported in pears in the Ukiah district.

The small amount of rainfall which occurred during the first week in the Upper Sacramento Valley was very beneficial to grains and grasses. Below freezing temperatures during the first two weeks made some orchard heating necessary for almonds which were in bloom. Warm weather and abundant sunshine during the last half of the month stimulated rapid growth of crops. Almonds and peaches leafed satisfactorily, and apricots and prunes advanced rapidly. Above normal temperatures accompanied by dry, northerly winds during the latter portion of the month made some plowing and planting possible in mountain valleys but had a desiccating effect on grasses and grain crops at lower elevations. Much barley was stimulated to head before proper growth had been attained with the prospects of a poor crop in some districts. Irrigation of pastures and meadows was resumed. The total precipitation of 0.12 inch at Red Bluff was the lowest since 1923 and the third lowest on record for March at that station.

Rains in the Lower Sacramento Valley during the first week interrupted some spraying and seeding operations. Frosts during the first portion of the month damaged some tomatoes and peppers in hot beds and nipped some almonds and apricots. The minimum temperature in Sacramento on the 3rd, 31°, was the lowest on record for that date and within two degrees of the lowest on record for March at that station. Outlying districts reported minimum temperatures ranging from 25° to 32° on the 2nd and 3rd. Above normal temperatures during the last three weeks benefited all growing crops. The lack of precipitation accompanied by drying, northerly winds permitted considerable progress toward a clean-up of the remaining, unharvested sugar beets. Plowing and cultivating activities made rapid progress. The crusting of surface soils hindered emergence of vegetables. In some districts crusting was so severe discs and harrows made little impression. By the end of the month alfalfa and grains were in need of moisture, and range grasses were beginning to dry. No measurable precipitation fell in Sacramento after the 6th. This was the longest March drought since 1934. The eighteen days with prevailing northerly winds resulted in the greatest number of days with northerly winds since 1944.

Below freezing temperatures in the Lower San Joaquin Valley during the first week resulted in slight damage to some crops. Mild day time weather with abundant sunshine favored rapid growth of all crops. Above normal temperatures during the latter portion of the month hastened bud swelling and blooming of all stone fruits. Extensive planting of spring truck crops resulted from the warm weather. The absence of rainfall made possible increased activity in cultivation of soils for cotton planting, etc. More tomatoes were planted under hot caps, and other truck crops were started. By the end of the month the drying winds and the absence of precipitation had become unfavorable for grains and grasses which were in need of one more good rain. Cotton was planted on the west side of the valley with the aid of irrigation. The frost on the 31st was the most damaging of the month. Reports from colder locations, such as, river bottoms and low-lying areas indicated losses to vines and fruit trees as great as 25 to 50 percent. As the damage was negligible in most districts the over-all loss amounted to only about two to three percent of the total crop. At Fresno the total precipitation for the month, 0.31 inch, was the least since 1944 and the fifth lowest since 1900. The lowest temperature ever recorded at Fresno in March occurred on the 3rd when the mercury dropped to 27°.

The brief cold period in the Upper San Joaquin Valley during the first portion of the month was more than offset by the above normal temperatures of the last two decades. Weather during the month was generally favorable for crops except for the lack of precipitation which was unfavorable for range grasses and dry-farmed grains on the west side of the valley. Ranges in some districts and unirrigated grains were reported in critically poor condition by the end of the month due to the lack of moisture. Cotton planting got underway after above normal temperatures raised soil temperatures high enough.

In the Santa Maria area light rains during the first week benefited lettuce and other vegetation, but the cold weather slowed the rate of development. Some peas, artichokes, and early lettuce were injured by frosts. High temperatures and the lack of measurable precipitation during the last two decades were generally unfavorable for most crops. Pastures started to dry in most districts, and truck crops were in need of more moisture.

Rains in the Los Angeles area during the first week were beneficial to crops. Near or slightly below freezing temperatures were experienced in the coldest areas during the first four days, and light orchard heating was necessary in some places, mostly for lemons. In the San Fernando district heavy leaf damage and some fruit losses were reported. Warm weather during the last two decades stimulated early deciduous fruits and lemons to bloom and resulted in some drop of mature Navel oranges and an increased population of aphids. Low relative humidities contributed to further depletion of soil moisture and increased irrigation requirements. All vegetation made rapid growth where moisture was adequate. Pest control operations were delayed by the low relative humidities. Pastures were reported going to seed prematurely, and grains were heading on very short stems. Some districts reported hay and grain crop failures. Towards the end of the month drought conditions reached serious proportions. Nearly all grains had deteriorated to near total loss on an estimated 100,000 acres of dry-farmed land. Work was rushed to turn under cover crops and prepare ditches for irrigation. By the close of the month irrigation was in progress on a near summer-time schedule.

Generous rains with considerable snow in the mountains in the San Diego area on the 1st benefited grain and hay crops but interrupted picking of avocados, lemons, and Navel oranges. Some hail damage was sustained by strawberries in the northern portion of San Diego County. The balance of the month was generally dry and warm, and soils dried rapidly. Unseasonably hot, dry weather on several days was detrimental to grains and range grasses but favorable for vegetables. Plantings under hot caps made rapid growth. Irrigated field crops remained in good condition. At San Diego, March was the driest since 1934 and the fourth consecutive month this season with below normal rainfall. Water tables were the lowest in many years, and the water supply situation was extremely serious in many localities as the end of the rainy season drew near. Hay and grain stands were very poor, and grains were heading on short stems everywhere.

Weather in the Imperial Valley was generally favorable for crop development and harvesting operations. Cold, cloudy conditions during the first few days were followed by seasonable conditions for the balance of the month. Sugar beets were in excellent condition and making an unusually good crop. Melons were generally well advanced.

HHE

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

/ Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

R This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.

S Storage precipitation station. Precipitation measurements, made at irregular intervals,will be published in the June, July and August or delayed data December issue of this publication.

S This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

R This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks, postal notes and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Volume LV No. 4

SAN FRANCISCO: 1951

E. L. Felton, Section Director, San Francisco

WEATHER SUMMARY

The average temperature for the State based on 312 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 57.4 degrees or 0.6 degree above the weighted mean. The unweighted average temperature based on the same 312 stations was 56.3 degrees or 0.7 degree above the unweighted mean. The highest temperature, 103 degrees, was recorded at Greenland Ranch and Cow Creek in Death Valley on the 9th, Mecca in the Coachella Valley on the 10th, and Indio U.S. Date Garden in the Coachella Valley on the 11th. The lowest temperature, 3 degrees, was recorded at Twin Lakes in Alpine County on the 30th.

The average precipitation for the State based on 313 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 1.48 inches or 0.07 inch below the weighted mean. The unweighted average based on the same 313 stations was 1.67 inches or 0.12 inch below the unweighted mean. Based on 668 stations listed in Table 3 the unweighted average was 1.74 inches or 0.05 inch below the unweighted mean. The greatest monthly total precipitation, 5.79 inches, was reported from Cuyamaca in San Diego County. Amboy in San Bernardino County reported no precipitation, and Greenland Ranch in Death Valley reported only a trace of precipitation. Squirrel Inn No. 2 in San Bernardino County reported the greatest daily total precipitation, 3.15 inches, on the 29th.

The snowpack in the Sierra Nevada was generally subnormal. The following table includes the April 1951, 1950 and 1949 snowfall and maximum depth on ground in inches for a number of stations in the Sierra Nevada.

Station	Mean Snowfall	Total Snowfall 1951	1950	1949	Greatest Depth 1951	1950	1949
Giant Forest	26.8	24.0	34.0	T	17	30	71
Grant Grove	23.6	32.0	32.0	T	21	52	81
Huntington Lake	20.6	31.0	36.0	3.0	21	61	77
Snow Laboratory, Central Sierra	29.5	29.5	61.6	0.8	69	152	83
Soda Springs	38.6	24.0	53.0	T	52	118	118

Drying weather in the north coastal area during the first three weeks permitted large scale farming operations to get underway. Considerable plowing and leveling, however, had been done. Grasses were generally plentiful but drying rapidly due to the lack of rains. Wherever possible, irrigation of pastures got underway. Rains during the last week brought farm work to a standstill but benefited crops already in the ground. Pastures which were impossible to irrigate were greatly assisted by the rains.

Above normal temperatures in the Central coastal area during the first half of the month were favorable for crops, but the lack of precipitation was generally unfavorable, particularly, for grains and grasses which had started to deteriorate in many districts. Top soils became quite hard in many places due to the lack of adequate precipitation. Below normal temperatures during the last half of the month delayed development of crops somewhat. Rains during the last week generally benefited range grasses but resulted in some damage to ripe strawberries and some hay. Strong winds on the last several days resulted in some broken limbs on fruit trees.

Warm weather in the Upper Sacramento Valley during the first three weeks was conducive to rapid growth in orchards and irrigated pastures, but the lack of appreciable precipitation was extremely unfavorable for grains and range grasses which were in great need of moisture. By the middle of the month much grain had deteriorated beyond recovery. Some sheep were started toward summer ranges in the mountains. The maximum temperature of 96 degrees at Red Bluff on the 9th was the highest temperature ever recorded so early in the season at that station. Rains during the last week were very helpful to crops. Grains, pastures, and clover were in great need of moisture. Some hail fell during thunderstorm conditions on the 29th.

In the Lower Sacramento Valley the longest early spring drought of record, 52 consecutive days without measurable precipitation, ended with a moderate rain on the 28th. The 92-degree maximum temperature in Sacramento on the 10th was the highest temperature ever recorded so early in the season at that station. Relative humidities as low as 12 percent accompanied the warm weather. The dry, warm weather following so closely the extremely wet soil conditions through March was very unfavorable for grain crops with reduced yields expected. Irrigation of orchards and other crops got underway in almost all districts. Generous rains on the 28th resulted in a temporary cessation of irrigation and cultivation operations. Hail accompanying the thunderstorms on the 28th and 29th caused considerable damage to crops. In the Colusa district light hail resulted in a slight thinning of some prunes and some lodging of grains. In the Placerville district hail resulted in losses to pears, plums, apples, and cherries estimated at $50,000. A belt extending from Long Valley through Newcastle, Auburn, Mt. Vernon, and Bowman sustained losses to plums, pears, and cherries estimated at $750,000. In the Sacramento district pears and plums were pitted and knocked from the trees; tomato plants, particularly field seeded plants, sustained some breaking of leaves. Losses in the Sacramento district were estimated at $175,000. Cherries, plums, prunes, and pears sustained damages estimated at $10,000 in Solano County. Temperatures throughout the month except during the second week were too cool for satisfactory development of asparagus, tomatoes, and strawberries.

In the Lower San Joaquin Valley the lack of adequate rainfall was unfavorable for grains and grasses. Cotton planting continued, however, pre-planting irrigation was necessary on the west side of the valley. Much above normal temperatures and abundant sunshine during the second week were ideal for field activities. The drying conditions, however, were unfavorable for winter grains, pastures, and ranges. Some slight heat damage was sustained by tomatoes and strawberries. Light precipitation on the 19th hampered some farming activities and in some places washed insecticides from trees, vines, and truck crops. Unsettled weather during the last week with generous rains on the 28th and 29th together with subnormal temperatures retarded the first cutting of alfalfa and delayed cotton planting. In the Stockton district hail resulted in damage to strawberries, cherries, and some hay that was cut. In the Modesto district rains damaged some strawberries, and strong winds resulted in some broken limbs on fruit trees. Hail in the Sonora district scarred pears; subfreezing temperatures resulted in heavy damage to apples, pears, and some other fruits. Losses in the Sonora district were estimated at $65,000 including a $15,000 loss of turkeys. Some cotton and plums in other districts sustained slight hail damage. The minimum temperature of 37 degrees at Fresno on the 30th was the lowest ever recorded on that date at that station. Some light frost was reported on some outlying districts on the 30th.

The lack of adequate precipitation in the Upper San Joaquin Valley during March and the first three weeks of April resulted in virtually a complete loss of unirrigated grains. Hot weather during the second week resulted in an increase in the rate of cotton planting and also a second irrigation prior to planting of cotton. Conditions were favorable for germination of cotton and development of other irrigated crops. Rains during the last week resulted in considerable damage to cut hay and ranges at low elevations. Unirrigated grains and range grasses at higher elevations, however, benefited from the rains. Some slight hail damage was sustained by cotton. Cattle were moved to mountain ranges considerably sooner than usual due to the short feed in the valley.

The lack of adequate precipitation in the Santa Maria area during the first three weeks was generally unfavorable for grains and grasses which were in great need of more moisture. The light rains during the third week were generally inadequate. Rains during the last week benefited some crops and saved some pastures. Warm weather following the rains was detrimental to some lettuce.

Rains in the Los Angeles area during the 3rd and 4th were generally too light to be of much benefit to agriculture. Irrigation in citrus groves was heavy due to the approaching bloom; however, the water supply shortage continued. Walnuts and other deciduous trees were irrigated where possible as the dry condition was contributing to slow, spotty blooming and leafing. Grains in the Beaumont district benefited from the rains. During the second week fairly high temperatures contributed to accelerated maturing of leafy vegetables and considerable blossoming and development of oranges. The low daytime relative humidities contributed to rapid drying of soils. Generally cloudy, cool weather with light rain during the third week favored vegetation and decreased water requirements somewhat. Irrigation, however, continued heavy. Non-irrigated orchards were reported slow in leafing, and some trees were dying as a result of several dry years. Strawberries in Orange County sustained some damage due to rains. Generous rains during the last week wet top soils and in some districts penetrated to a depth of eighteen inches. Field crops and gardens benefited greatly, and heavy irrigation was generally interrupted due to the rains. Grains had generally deteriorated beyond recovery, but some pastures were expected to revive. Rains washed insecticides from trees, and interrupted Navel orange harvesting. Strong winds from the 28th to 30th resulted in losses to marine craft and installations in the coastal area around Los Angeles Harbor estimated at $250,000 and about $50,000 additional damage to trees, utility poles, signs, plate glass, etc. Three men were killed in craft near the Los Angeles Harbor.

Showers in the San Diego area on the 3rd and 4th were of little benefit to crops. Many fields of barley and oats were pastured due to the drought. Temperatures throughout the month were generally above normal, and irrigation in citrus groves increased. Tomatoes, squash, cucumbers, and sweet corn made rapid growth. Grains and range grasses continued in poor condition due to the lack of moisture. Precipitation during the last week benefited crops but produced little runoff. Weather in the Imperial Valley was favorable for crops. Cantaloupes and other melons developed rapidly, and sugar beets and flax continued in excellent condition.

HHE

DATA FOR THE PERIOD BEGINNING WITH OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ON AN AREAL BASIS AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau
d cooperative weather stations, this bulletin series contains records from
droclimatic Network Stations which were formerly reproduced in the Hydrolo-
c Bulletin Series. The Hydroclimatic Network is a nationwide net of rain
ges--mostly of the recording type which produce continuous records of pre-
pitation. It was established in 1939 at the request of the Corps of Engin-
rs, Department of the Army, to supplement existing precipitation stations
order to provide records of rainfall intensity which were essential to the
anning of flood control and related works by the Corps of Engineers. This
twork, now numbering about 2,000 recording, and 1,000 non-recording rain
ges, has been maintained by the Weather Bureau through working funds trans-
rred annually to the Weather Bureau by the Corps of Engineers. These trans-
rs averaged about $250,000 per year between 1940 and 1944, and nearly
75,000 since that date. For the years 1940-42, the Department of Agricul-
re transferred about $100,000 per year to provide data required in its work,
d since 1947 the Bureau of Reclamation has transferred about $25,000 per
year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydro-climatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January, 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observat on. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are a 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.

S Storage precipitation station. Precipitation measurements, made at irregular intervals,will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and mon orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to t Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WEATHER SUMMARY

The average temperature for the State based on 315 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 63.2° or 0.1° above the weighted mean. The unweighted average temperature based on the same 315 stations was 61.5° or 0.2° above the unweighted mean. Cow Creek in Death Valley reported the highest temperature for the State with a maximum of 120° on the 27th. Twin Lakes in Alpine County recorded the lowest temperature on the 2nd, 10°.

The average precipitation for the State based on 318 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.95 inch or 0.15 inch above the weighted mean. The unweighted average based on the same 318 stations was 1.00 inch or 0.10 inch above the unweighted mean. Based on 658 stations listed in Table 3 the unweighted average was 0.98 inch or 0.08 inch above the unweighted mean. Vollmers in Shasta County reported the greatest monthly total precipitation, 5.96 inches. 63 stations, mostly in Southern California, reported no measurable precipitation. The greatest daily amount, 3.11 inches, was reported from Nevada City in Nevada County on the 4th.

Snow Laboratory Central Sierra in Nevada County at 6902 feet above sea level recorded the greatest monthly snowfall, 23.0 inches. Some other snowfall totals were: Soda Springs, 20.0 inches and Twin Lakes, 21.0 inches.

Rains in the north coastal area during the first half of the month brought most field operations to a halt. Most crops progressed satisfactorily and benefited from the rains and above normal temperatures. Fresh northerly winds during the last half of the month contributed to drying of soils to a large extent. By the end of the third week soils had generally dried sufficiently to permit resumption of large scale farming operations. By the end of the month some pastures were under irrigation where possible.

In the central coastal area rains during the first week damaged strawberries and some hay but benefited some range grasses. During the last three weeks weather was generally favorable for crops; however, grains and grasses were in need of more rain. Much above normal temperatures on the 25th and 26th contributed to rapid ripening of cherries and development of other crops.

Rains in the Upper Sacramento Valley during the first half of the month generally benefited late planted grains. Orchards also benefited from the added moisture. Some alfalfa hay was damaged on the ground and baling operations were interrupted due to the rains. Warm, dry weather during the last half of the month was favorable for drying alfalfa hay. Drying northerly winds on the 21st dehydrated alfalfa hay to the extent that baling operations were generally suspended in many fields. Field crops, truck crops, pastures, and clover where irrigated, developed rapidly.

Rains during the first week in the Lower Sacramento Valley resulted in some rotting and splitting of ripening strawberries and cherries. Below normal temperatures were not beneficial for development of berries and tomatoes. Scattered rain showers in the foothills during the second week resulted in some additional damage to early cherries and strawberries. Late plantings of field seeded tomatoes were handicapped somewhat by crusting of the top soils due to rains of the first week. Above normal temperatures during the last three weeks favored rapid growth of truck crops particularly tomatoes and strawberries; however, due to the lack of precipitation the need for irrigation increased. Much above normal temperatures on the 25th and 26th and the availability of sufficient irrigation water resulted in rapid growth and development of sugar beets, tomatoes, and peaches. The maximum temperature of 100° on the 25th was the highest on record for May 25th in Sacramento. The high afternoon temperatures were particularly favorable for fuming sulphur for insect and mildew control.

Unsettled weather conditions in the Lower San Joaquin Valley during the first two weeks hindered farming operations and together with below normal temperatures resulted in considerable necrosis and weakening in cotton plants to the extent that some replanting was made necessary. Showers on the 6th were unfavorable for hay, cotton, and dusting operations but benefited pastures and ranges. Strong winds with strong gusts on the 10th resulted in sandblasting of young cotton, fruit blown from plum, apricot, and almond trees, and some damage in vineyards. Above normal temperatures, light winds, and abundant sunshine during the last half of the month favored crops and farming activities. Cotton particularly manifested considerable growth as a result of the higher temperatures. Haying operations increased, and crop spraying and dusting operations progressed. Much above normal temperatures occurred on the 26th and 27th. The daily maximum temperature, 103°, and the daily minimum temperature, 68°, at Fresno on the 26th were the highest maximum and minimum ever recorded at that station for May 26th.

Cool, cloudy weather in the Upper San Joaquin Valley during the first half of the month was generally unfavorable for cotton. Weather conditions necessitated increased activity in dusting of grapes for mildew and potatoes for blight. Strong winds on the 10th and 11th resulted in some damage to plums. Above normal temperatures during the last half of the month generally favored cotton and other crops. The daily maximum temperature, 107° in Bakersfield on the 26th, was the highest May temperature recorded since 1910 at that station.

Fair weather in the Santa Maria area favored most crops although some wind damage was sustained by walnuts in the San Luis Obispo district. Drying winds hampered planting of flowers for seed purposes in the vicinity of Lompoc and Santa Maria. Hill pastures and some grain crops showed some improvement due to rains late in April. By the end of the month some pastures were again in need of additional moisture.

Sunny weather and generally above normal temperatures in the Los Angeles area favored growth of crops. Hay crops were very poor and dry-farmed grains were estimated at one-third of normal crop due to the winter drought.

Weather in the San Diego area was generally favorable for crops. Irrigated truck crops looked good tomatoes made rapid progress. Ranges continued poor except in some districts in the mountains. This was the first May without measurable precipitation at San Diego since 1941.

In the Imperial Valley warm weather favored ripening of cantaloups and other crops.

DATA FOR THE PERIOD BEGINNING WITH OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ON AN AREAL BASIS AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly 375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 4 are from recording gages. Traces are not shown.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry. When hourly precipitation is missing or accumulated for several days, only the first and last days are shown in Table 4.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

6 Station not equipped with a recording gage.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

WEATHER SUMMARY

The average temperature for the State based on 305 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 69.8° or 0.1° below the weighted mean. The unweighted average temperature based on the same 305 stations was 67.5° or 0.2° below the unweighted mean. Cow Creek in Death Valley reported the highest temperature, 121°, on the 28th and 29th. Boca in Nevada County recorded the lowest temperature, 17° on the 7th.

The average precipitation for the State based on 307 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.11 inch or 0.20 inch below the weighted mean. The unweighted average based on the same 307 stations was 0.04 inch or 0.29 inch below the unweighted mean. Based on 634 stations listed in Table 3 the unweighted average was also 0.04 inch or 0.29 inch below the unweighted mean. Termo in Lassen County reported the greatest monthly total precipitation, 1.58 inches. No measurable precipitation was reported from 433 stations scattered throughout the State. The greatest daily amount, 1.33 inches, was recorded at Vinton in Plumas County on the 21st.

The general lack of precipitation in the north coastal area during the month was beneficial to haying. Irrigation of pastures and crops continued where possible. The fire hazard in forests increased as the dry conditions continued.

Weather in the central coastal area was cool but generally favorable for crops. Apricots and some other fruits ripened slowly in some districts due to the cool weather.

Winds and low relative humidities in the Upper Sacramento Valley during the first several days contributed to drying conditions for crops. Warm weather favored growth of most crops, and alfalfa and grain hay cutting and baling operations were under way on a large scale. Hot weather during the second decade resulted in a need for considerable irrigation of pastures and field crops and the rapid ripening of apricots.

In the Lower Sacramento Valley during the first several days warm weather benefited tomatoes, strawberries, and other truck crops; however, drying northerly winds contributed to increased transpiration losses from plants and increased irrigation requirements. Strong winds contributed to breaking of young vine shoots and bruising of fruit in orchards. Dusting and spraying operations were also curtailed due to strong winds early in the month. Except for hot weather on the 13th and 14th conditions were generally cool but satisfactory for growth and development of crops.

Strong winds in the Lower San Joaquin Valley on some days during the first week hampered crop dusting and spraying operations, hay cutting and baling, and some crop cultivation activities. Some sand-blasting of cotton was reported from the west side of the valley. Warm weather during the last three weeks was favorable for cotton, truck crops, grapes and various other fruits. High temperatures during the second decade resulted in some slight sunscald on Muscat grapes. Winds during early morning hours during the last three weeks were generally light enough for satisfactory dusting operations.

Abundant sunshine and moderate temperatures throughout the month in the Upper San Joaquin Valley favored growth of crops. Moderate winds and the absence of precipitation permitted field work to continue unhampered. Above normal temperatures during the second decade contributed to checking insect pest infestations which normally occur during this season.

Weather conditions in the Santa Maria area were generally favorable for development of most crops; however, some 'sliming' was reported in lettuce. Harvesting of barley, oats, and wheat in the San Luis Obispo district was slowed somewhat due to foggy weather.

Moderate temperatures and partly cloudy skies in the Los Angeles area favored a decreased rate of soil moisture depletion. The lack of abundant sunshine and high temperatures contributed to a slower rate of development of deciduous fruits. Generally truck crops and harvesting operations made considerable progress.

Weather in the San Diego area was generally seasonable. Hot, dry weather during the first portion of the month contributed to a considerable reduction of the Thompson seedless grape crop in the Borrego Desert area. Drought generally reduced grain crops to about fifty percent of normal.

HHE

DATA FOR THE PERIOD BEGINNING WITH OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ON AN AREAL BASIS AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS. † Less than one-half.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

See reference notes following Station Index.

CORRECTED DATA

JANUARY 1950	Quincy RS, precipitation on 11th should be 1.56, monthly total 11.17, departure 3.61. Annual 1950 total should be 66.98, departure 26.96.
APRIL 1950	Santa Barbara, highest temperature should be 91° on 2nd.
	Santa Barbara CAA AP, highest temperature should be 91° on 2nd.
MAY 1950	Orland, min. temperature on 3rd should be 32°.
OCTOBER 1950	El Centro, mean temperature should be 77.6°, departure 2.5° and lowest temperature 49°. See Delayed Data, Table 5 for corrected daily temperature data.
OCTOBER 1950 through JANUARY 26, 1951	San Nicolas Island, delete precipitation record, should be no record.
NOVEMBER 1950	Deep Springs 11 NW and Potrero Seco, see Delayed Data, Table 3 and 4 for Corrected Data.
DECEMBER 1950	Redding Fire Station 2, delete greatest snow depth on ground should be no record.
ANNUAL 1950	Colgate PH, precipitation annual total should be 59.81.
	Sierraville RS, precipitation annual total should be no record.
JANUARY 1951	Lakeport, precipitation on 29th should be Trace, monthly total 6.93, departure .63, greatest day 2.53 on 22nd, days with .01 or more 13, .50 or more 5 and 1.00 or more 1. Snowfall on 29th should be Trace, greatest depth on ground for 29th 0.0 and total snowfall Trace.
FEBRUARY 1951	Fort Jones RS, monthly snowfall total should be 2.6.
	Santa Margarita Booster Station, precipitation on 28th should be .10 and monthly total 2.37.
MARCH 1951	Santa Ana No. 3, add hourly precipitation, accumulated (*) amount .12 from 7 p.m., 30th to 6 p.m. 31st. Monthly total should be .79.
APRIL 1951	Slack Creek, delete daily and hourly precipitation on 30th, should be no precipitation. Monthly total should be .92.
	Ozena, delete precipitation on 7th, add .07 on 4th and 18th. Monthly total should be 1.99.
MAY 1951	Newman, add daily precipitation as follows: 2nd, .01; 3rd, .05; 5th, .04; 10th, .01. Monthly total should be .11, departure -.28, greatest day .05 on 3rd and days with .01 or more 4.
ANNUAL 1950	Las Plumas, precipitation annual total should be 71.39.
